

Project Design Phase
Proposed Solution Template

Date	16 July 2026
SID	SWUID2026198226
Project Name	AI-Powered Customer Support & Service Automation.
Maximum Marks	2 Marks

Proposed Solution Template:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Traditional manual case handling methods lead to significant operational bottlenecks, such as delayed response times, fragmented customer data across disparate platforms, duplicate or incomplete case records, and highly inconsistent case documentation formats.
2.	Idea / Solution description	An intelligent, unified customer support system built on the Salesforce platform. The system uses custom data objects (Customer__c, Merchandise__c, Product__c, Order__c, User_Case__c) to organize enterprise information. It features automated backend case classification/routing via Record-Triggered Flows alongside a dynamic Lightning Application console for the support team.
3.	Novelty / Uniqueness	The solution integrates Salesforce Prompt Builder and Agentforce to deploy a generative AI template (MetaDataInspection). This setup auto-generates contextual, highly structured, and actionable case summaries natively on record page layouts, removing the need for third-party AI integrations or manual agent summarization.
4.	Social Impact / Customer Satisfaction	Eliminates manual friction for agents, boosting employee productivity and reducing cognitive fatigue. For end-customers, it delivers significantly reduced wait times, faster issue resolution, and high touchpoint transparency, directly improving customer retention and brand satisfaction scores.

5.	Business Model (Revenue Model)	Reduces operational overhead and resource hours required for manual ticket sorting and data entry. It enables a lean support squad to successfully scale their caseload without a linear increase in staffing costs, while centralized Salesforce Lightning Dashboards provide managers with instant visibility into key performance metrics to minimize lost revenue from unresolved cases.
6.	Scalability of the Solution	The cloud-native architecture natively satisfies enterprise-level data volume requirements through automated execution parameters. Its declarative framework allows new routing rules, queues, validation criteria, and prompt templates to be updated seamlessly as the organization's product line or support scale expands.
